Report 1: Project Description Report

Project Title: School Management System

Business Idea: A school needs an information system to manage student records, teacher information, courses, and student enrolments digitally and efficiently.

1. Problem Statement & Purpose

Problem Statement: Traditional paper-based record-keeping leads to data loss, slow retrieval of student information, and difficulties in tracking course enrolments.

Purpose: The purpose of this system is to provide a centralized digital platform to store, manage, and retrieve academic data accurately, reduce manual errors, and improve administrative efficiency.

2. Project Scope

What is covered: Managing student profiles, teacher details, course catalog information, and student course enrolments.

What is excluded: Payroll processing, financial fee management, and daily classroom timetabling (as the focus is purely on core data modeling).

3. Main Classes & Responsibilities

Student: Manages student personal details and allows them to register for courses and view grades.

Teacher: Manages teacher profiles, course assignments, and grade entries.

Course: Stores information about school subjects, credit hours, and course codes.

Enrollment: Represents the association/link between a student and the courses they take, tracking the enrollment date and status.
